

Is Chiropractic Treatment Medically Necessary?

Medical necessity of primary care treatment from a chiropractic physician includes the following nervous system related symptoms, but is not limited to them:

Uncontrolled Acute or Chronic Symptoms Related to Spinal Nerve Irritation:

Postural asymmetry, Spinal column deviation, Spinal or pelvic subluxation, Spinal pain:

Blurred Vision, Dizziness, Fatigue, extremity joint pain, Joint laxity/dyskinesia, Headaches:

Heart palpitation, Insomnia, Lack of concentration, Incoordination, Muscle hypertonicity:

Muscle weakness/atrophy, Numbness, Poor circulation, Poor eyesight, Poor memory:

Soft tissue Swelling, Stiffness, Visceral Irregularity,

Lung, heart, digestion, liver, kidney, glandular dysfunction, bowel and or bladder problems:

All of the above symptoms can develop due to misalignment of spinal vertebrae causing abnormal function to the spinal nerves. This abnormal spinal alignment and abnormal pressure are called 'subluxations'. They disrupt proper communication between the brain and spinal cord, as well as between the spinal cord and the body organs and tissues.

The frequency and duration of chiropractic care for these symptoms depends on how and when the conditions arose and whether the symptoms are acute, sub-acute or chronic. Your chiropractic physician will judge the frequency of your adjustments based on examination findings. Chiropractic care is safe and millions of spinal adjustments are carefully delivered to satisfied patients every day!!
